

GULF GLASS INDUSTRIES

Quality process delivers quality glass

Glass Façade —————> Energy Saving Glass Facade
—————> Energy Producing Glass Façade

The above transition clearly defines the development of glass technology, and its scope to maintain ecological balance to save and produce Energy. Glass façade is no more a mere skin for the building but can be converted into a power generator and revenue generator. Advancement in technology unleashes opportunities; however glass fabrication becomes a critical process. The expertise in glass processing plays a prime role in converting and providing a complete solution to the facade installer which makes the project a successful one. Sophistication in glass coatings demands high quality processing machines and highly skilled personnel. A bad

machine or mis-handling can damage the sophisticated coatings that add value to the glass.

The know-how, expertise and technology of companies like GGI become highly relevant in such scenarios. A company who believes in quality glass processing can stay ahead in the market by providing value added products and services. GGI is a leader in processing triple silver glass coatings, which provide maximum light or a transparent façade with minimum heat gain. They are equipped with most modern machines and facilities that can provide maximum process under a single roof which

has enabled them to supply processed glass to more than fifty countries from their facilities in Sharjah.

GGI considers fast changing technology as an opportunity rather than a threat or a hurdle that slows down all process, by implementing new technology or training people. "We are keen on investing in new technology and enhancing employees skills that will result in value added products and services, thereby striving to maintain & excel our quality standards and our commitment to all our customers. This will distinguish GGI as a clear market leader." Mr.Samih Fatayergi of GGI commented.
